

ALL IAN

The Human Programming Interface

No tokens. No tiers. No bullshitting.

Artificial Intelligence was the prototype. All Ian is production.

Standalone parody brand | Tired of Tech launch deck

The market failure

AI is apparently innovation until someone asks for context.

Token pricing punishes the exact behaviour that creates value: asking more questions.

Per-seat pricing punishes collaboration, because software is now a hostage situation.

Enterprise tiers hide the price until sales has finished sniffing your budget.

Most organisations do not need another AI wrapper. They need judgement.

```
hpi://all-ian/v40/inference

POST /hpi/v1/ask
{
  "payload": "Can you just take a quick look at this?",
  "mode": "TiredOfTech",
  "organisation_context": "messy",
  "billing": "Salary"
}

200 OK
{
  "answer": "This is not quick. Here is the actual problem.",
  "cost_per_call": "falling",
  "sarcasm_leakage": "within expected tolerance"
}
```

Introducing All Ian (TM)

The Human Programming Interface for organisations that have already tried software.

No tokens

Flat-fee salary-class access means cost per HPI call falls with use.

No tiers

One model. No Pro Max Ultra Platinum Goblin Edition.

No bullshitting

Hardcoded alignment layer. Cannot be disabled without voiding warranty.

Model architecture

Mixture of experts, tragically trapped in one skull.

IT Ops

Systems, support, incidents, continuity

Security

ISMS, access, EDR/XDR, SIEM, supplier risk

Compliance

ISO, audit evidence, policies, controls

Broadcast

Explain live without killing the audience

Creative

Brands, ventures, formats, service design

Cynicism

Protects production from bullshit

Training corpus

Not scraped. Survived.

20+ years IT, IS and operations scar tissue.

Scaleup security, ISMS, SecOps, EDR, SIEM, vSOC/MDR and compliance work.

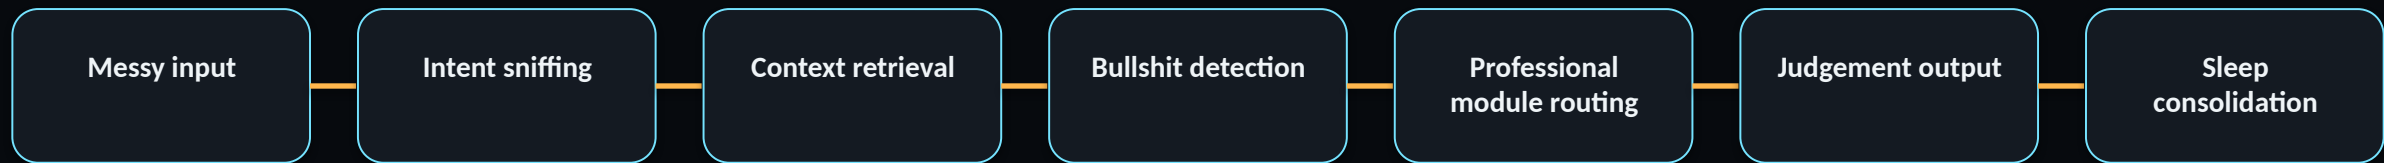

SMB and charity consultancy, site audits, training, digital transformation and infrastructure upgrades.

Community radio, event hosting and explaining difficult things without sounding like a dishwasher manual.

Family, pets, sleep debt and the constant knowledge that things could be simpler.

HPI call flow

From vague human noises to useful output.

Always On memory

Offline 6-8 hours per day, like a coward.

Daily inputs are amalgamated, recombined, crosslinked and promoted to long-term memory.

Low-frequency memories may acquire embellishment, like any biological autocomplete engine with emotional residue.

High-work-mode storage improves recall; weak notes reduce accuracy.

Interrupt storms from OU#1, OU#2, domestic cluster or pets may cause context fragmentation.

AI parallel

Context window = working memory

Vector DB = associative memory

RAG = "I remember something like this"

Hallucination = confident embellishment

Pricing heresy

Th

Cost per HPI call the forbidden economics

higher

Commercial terms

Simple, therefore unacceptable to SaaS pricing goblins.

Salary-class

Works best at GBP 100k+. Ongoing access, compounding context, falling cost per call.

On-demand cleanup

Starts at GBP 1,250/day. For AI damage, fired juniors, escaped seniors and production soup.

Charity mode

Limited free allowance plus heavy discounts for supported organisations worth the model's time.

Security and compliance layer

Native. Not a paid add-on called TrustCloud Elite.

ISMS design and maintenance.

ISO 27001, 9001 and 14001 experience.

Supplier risk, access control, IAM/SSO, MDM/RMM and audit evidence.

Endpoint, EDR/XDR, SIEM, monitoring, alerting and incident response triage.

Policy and training output in plain English.

Output mode

Board-safe risk summaries, trustee-safe explainers, technical action plans and the occasional necessary sentence: "This is bollocks."

Creative engine

Constraint-based recombination, not random slop humour.

everwished graph

Simplicity, credibility, no bullshit, profit as side-effect.

Media layer

Radio, shows, hosting, Tired of Tech, Just Duckin' About.

Community layer

charIT, discounts, local resilience, useful work.

Venture swarm

Bills, Buslane, Green-squared and other suspiciously viable side quests.

Plugin ecosystem

Because every AI launch needs plugins nobody asked to install.

ComplianceGoblinTranslator

SupplierWrangler

LegacySystemNecromancer

RadioVoice

CharityDiscountEngine

TiredOfTechRant

DogWalkDefrag

OffspringModelScheduler

NoBullshitClause

Hardcoded plugin

NoBullshitClause cannot be disabled. Attempts are logged, mocked and used in future training examples.

Known bugs

The scratches have mostly been buffed out. Mostly.

SarcasmLeakage

Vendor decks, AI hype, renewal quotes

OverBuilder

Small asks hiding a large system

MemoryEmbellishment

Old, weakly indexed events

SleepDependency

Biology. Tedious.

TBDBacklog

Deep defects with no patch ETA

CareOverflow

Trying to help more than the invoice requires

Ad campaign

Fake AI launch. Real value underneath.

YOUR AI HAS A CONTEXT WINDOW. OUR AI HAS 20+ YEARS AND A BEARD.

STOP RENTING INTELLIGENCE BY THE TOKEN.

FIRED YOUR DEVS? CLEANUP STARTS AT GBP 1,250/DAY.

ALWAYS ON* (*offline 6-8 hours for memory consolidation).

NO TOKENS. NO TIERS. NO BULLSHITTING.

Use cases

Deploy where the mess has become self-aware.

Scaleup security and operations maturity.

Charity IT/compliance rescue without enterprise predation.

Supplier/tooling rationalisation.

AI-damage cleanup after team vandalism by spreadsheet.

Technical communication, training, radio and stakeholder explanation.

Creative brand/service development for the project swarm.

The final claim

Answers are cheap. Understanding is expensive.

All Ian (TM): Context in. Judgement out. The cost per call falls with use, the model improves over time, and the bugs are at least honestly documented.
